

Boldon James Releases MasterKey.net

MasterKey.net extends OWA address book interface to include additional address books searchable via LDAP

Maidenhead, Berkshire, U.K. – 14th July 2005

Boldon James today announced the release of MasterKey.net, which extends the Outlook Web Access (OWA) address book interface to include additional address books searchable via LDAP. Out of the box, the OWA clients address book provides access to the Global Address List (GAL) and Contacts and with MasterKey.net, customers can rollout Exchange 2003's OWA client secure in the knowledge that users will still have access to the corporate white pages directory, a standard feature of the Outlook desktop client.

Martin Sugden, CEO at Boldon James commented, "By enabling LDAP support from Outlook Web Access MasterKey.net provides a major feature enhancement to the thin client. More organisations can now enjoy increased productivity gains and lower TCO of Microsoft's OWA client with this critical gap now closed". Sugden continues, "Although it has only been out in the market for a short time it is already on trial at a number of very large central government and commercial organisations both here in the UK and in the US and the feedback indicates that the product is simple to use and robust, it does what it says on the tin".
